

Node assembly instructions

The serial node and the INPUT modules are supplied complete with the fixing screws (n.4 socket head cap screws M4x50 to be tightened via a 3 mm allen key) and with two blanking plates which enable the expansion of the system with further INPUTS modules. It is also separately provided a green sticker to be applied in the box, for modules protection (from dust and moisture). The serial communication node is connected to the valve manifold via a 37 pin sub-D connector. The INPUT module is connected to the serial communication node or to another INPUT module via a 12 pin strip connector. To do this it's needed, eventually, to remove the green sticker from the module it is going to be attached to and, in any case, to apply the sticker to the last assembled module (to guarantee the maintenance of protection).

Before the assembly of any module it is necessary to turn off the power.

**Technical features**

Protocol	CANopen	DeviceNet	PROFIBUS DP
Part number	5525.32T	5425.32T	5325.32T
Housing	Reinforced technopolymer		
Power supply	+24VDC ±10%		
Power consumption	30 mA (Without INPUT modules)	30 mA (Without INPUT modules)	50 mA (Without INPUT modules)
Power consumption	60 mA (With 4 INPUT modules)	60 mA (With 4 INPUT modules)	80 mA (With 4 INPUT modules)
PNP equivalent OUTPUT	+24VDC ±10%		
Maximum current per OUTPUT	100 mA		
Maximum OUTPUT number	32		
PNP equivalent INPUTS	+24 VDC ±10%		
INPUT module max. current	200 mA for each INPUT module (Cod. 5225.12T)		
Maximum INPUT	32 (4 INPUT modules)	32 (4 INPUT modules)	64 (8 INPUT modules)
Power supply connector	M12 4 pin A type male (IEC 60947-5-2)	M12 4 pin A type male (IEC 60947-5-2)	M12 4 pin A type male (IEC 60947-5-2)
Network connectors	M12 male and female 5 pin A type (IEC 60947-5-2)	M12 male and female 5 pin A type (IEC 60947-5-2)	M12 male and female 5 pin B type
INPUT connector	M12 5 pin female		
IP protection grade	IP65 when assembled		
Temperature range	0°C / + 50°C		

INPUTS (Cod. 5225.12T)

Modules are fitted with M12 5 pin female connector.

The INPUTS are PNP equivalent 24VDC ±10%.

To each connector it is possible to connect both 2 wires INPUTS (switches, magnetic switches pressure switches etc) or 3 wires (proximity, fotocellule, electronic end of stroke sensors etc).

The maximum current available for all 8 Inputs is 200 mA.

Each module includes a 200 mA self-mending fuse. Should a short circuit or a overcharge (overall current >200mA) occur the safety device intervenes cutting the 24VDC power supply to all M12 connectors on the module and switching off the green led PWR. Any other Input module connected to the node will remain powered and will function correctly.

Once the cause of the fault is removed the green led light up indicating the ON state and the node will re-start to operate. The Maximum number of INPUT modules supported is 8.

PROFIBUS DP (Cod. 5325.32T)**Electric supply**

The node electric supply is achieved via a round M12, 4 pins male connector. As the electric supply 24V to the node is kept separate from the electric supply 24V to the outputs it is possible to turn off the outputs keeping the node on.

ATTENTION: If the 24VDC is not connected to outputs power supply pin (pin 4 of 4 pins connector) solenoid valves are turned off.

**Connection to the network**

The connection of the node to the PROFIBUS DP network is achieved via two M12 B type round connectors one male and one female connected in parallel.

The pin lay out conforms to the PROFIBUS Interconnection Technology (Version 1.1 August 2001).

PIN	DESCRIPTION
1	+24 VDC (NODE & INPUTS)
2	NC
3	GND
4	+24 VDC (OUTPUTS)

Connection to the network

The connection of the node to the PROFIBUS DP network is achieved via two M12 B type round connectors one male and one female connected in parallel.

The pin lay out conforms to the PROFIBUS Interconnection Technology (Version 1.1 August 2001).

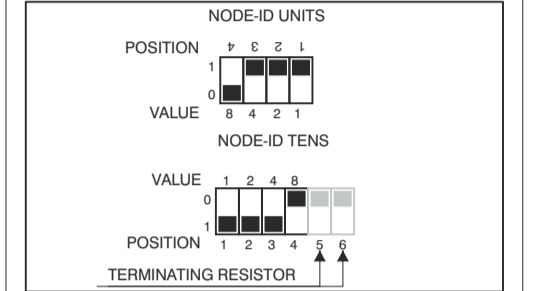

PIN	SIGNAL	DESCRIPTION
1	VP	Power supply plus, (P5V)
2	A-line	Receive / Transmit data -N, A-line
3	DGND	Data Ground (reference potential to VP)
4	B-line	Receive / Transmit data -plus, B-line
5	SHIELD	Shield or PE

Node-id (address)

On power-on the CPU reads the node address which is set via dip-switches.

The node ID must be comprised between 1 and 99, and is codified in BCD: 4 dip_switches for the units and 4 dip_switches for the tens. The 0 value is not allowed. After a modification to the node address it is necessary to switch off and on the electric supply for the CPU to acquire the new values.

All devices in the network must have a different address.

The device has a terminating resistor built in which, if the slave occupies the last position in the network, must be switched-on via the relevant switches moved to position 1 (the switches are shown with light colour)

Status indicators

The PROFIBUS DP slave is fitted with 4 LED (1 red and 3 green), which indicate the device working state as follows:

PWR	NODE OUT	DESCRIPTION
GREEN LED	ON	indicates power supply of node+INPUTS
GREEN LED	ON	indicates power supply of OUTPUTS
BUS	Norm operation	green led: indicates that the unit has been initialised and is in the DATA EXCHANGE mode
	Bus error	red led: indicates that the device is not communicating.

The .gsd file for node configuration is downloadable from www.pneumaxspa.com

DeviceNet (Cod. 5425.32T)**Electric supply**

The node electric supply is achieved via a round M12,4 pins male connector. As the electric supply 24V to the node is kept separate from the electric supply 24V to the outputs it is possible to turn off the outputs keeping the node on.

ATTENTION: If the 24VDC is not connected to outputs power supply pin (pin 4 of 4 pin connector) solenoid valves are turned off.

**Node-id (Address)**

On power-on the CPU reads the node address which is set via dip-switches. The node address must be comprised between 1 and 63 the codification is binary and the "0" value is not admitted by the DeviceNet specifications therefore is "0" value is read the node enters in fault mode indicating an anomaly via the red led which will flicker (50 ms on - 50 ms off). After a modification to the node address or the Baud rate it is necessary to switch off and on the electric supply for the CPU to acquire the new values.

All devices in the network must have a different address.

**Baud rate**

The communication speed is set via three dip-switch which give the possibility to select different values.

All devices mounted on the network must have the same working speed.

The device has a terminating resistor built in which, if the slave occupies the last position in the network, must be switched-on via the relevant switch moved to position 1 (the switch is shown with light colour)

Status indicators
The DeviceNet slave is fitted with 3 LED (1 red and 2 green), which indicate the device working state as follows:

RED LED (ERR)	GREEN LED (BUS)	DESCRIPTION
OFF	OFF	Device TURNED OFF
OFF	FLASHING	CONFIGURING status
OFF	ON	ESTABLISHED status
FLASHING	OFF	TIMED OUT status
FLASHING	FLASHING	COMM FAULT status
FLASHING	ON	WAIT RESP status
ON	OFF	FAULT status
ON	FLASHING	NON EXISTENT status

CANopen (Cod. 5525.32T)**Electric supply**

The node electric supply is achieved via a round M12,4 pins male connector. As the electric supply 24V to the node is kept separate from the electric supply 24V to the outputs it is possible to turn off the outputs keeping the node on.

ATTENTION: If the 24VDC is not connected to outputs power supply pin (pin 4 of 4 pin connector) solenoid valves are turned off.

PIN	DESCRIPTION
1	+24 VDC (NODE & INPUTS)
2	NC
3	GND
4	+24 VDC (OUTPUTS)

Connection to the network

The connection of the node to the CANopen network is achieved via M12 5pin round connector one male and one female connected in parallel. The pin lay out conforms to the CIA Draft Recommendation 303-1 (V.1.3 dated 30 December 2004)

PIN	SIGNAL	DESCRIPTION
1	CAN_SHLD	Optional CAN Shield
2	CAN_V+	Optional CAN external positive supply (Dedicated for supply of transceiver and Optocouplers, if galvanic isolation of the bus node applies)
3	CAN_GND	Ground / 0V / V-
4	CAN_H	CAN_H bus line (dominant high)
5	CAN_L	CAN_L bus line (dominant low)

Node-id (Address)

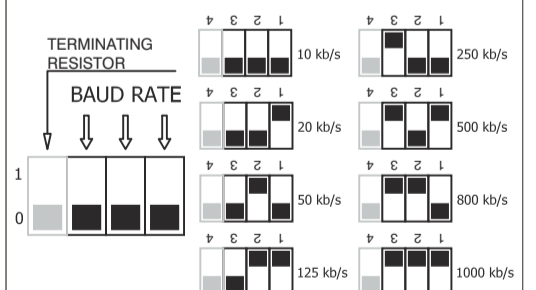

On power-on the CPU reads the node address which is set via dip-switches. The node address must be comprised between 1 and 63 the codification is binary and the "0" value is not admitted by the CANopen specifications therefore is "0" value is read the node enters in fault mode indicating an anomaly via the red led which will flicker (50 ms on - 50 ms off). After a modification to the node address or the Baud rate it is necessary to switch off and on the electric supply for the CPU to acquire the new values.

All devices in the network must have a different address.

**Baud rate**

The communication speed is set via three dip-switch which give the possibility to select different values.

All devices mounted on the network must have the same working speed.

The device has a terminating resistor built in which, if the slave occupies the last position in the network, must be switched-on via the relevant switch moved to position 1 (the switch is shown with light colour)

Status indicators

The CANopen slave is fitted with 3 LED (1 red and 2 green), which indicate the device working state as follows:

RED LED (ERR)	GREEN LED (BUS)	DESCRIPTION
OFF	OFF	TURNED OFF or INIT status
OFF	BLINKING	PRE-OPERATIONAL status
OFF	SINGLE FLASH	STOPPED status
OFF	ON	OPERATIONAL status
FLICKERING	OFF	Node address = 0
SINGLE FLASH	ON/BLINKING	CAN communication error
DOUBLE FLASH	ON	GUARD TIME error
